Version: 8.0.19617Q: Cross-Platform Executables For Android and iOS Is there any way to build cross-platform (iOS and Android) executables in JavaScript? I have some iOS and Android applications, and I'd like to write a single app for both, making it easy to port from the desktop to mobile. The closest I've found to this is Windows Phone, where a JavaScript command is converted to platform-specific binaries. Is there any way to do this in WebAssembly? Is there any working examples? A: If you have Java installed, a JavaFX or Vaadin application should work. These apps are basically a WebAssembly module with a JVM wrapped around it. If you've never developed in Java before, the learning curve is pretty steep, but it's been stable for years now and there's an extensive community of support. If you're open to non-Java options, you have a couple of Java-based options, one based on Android and the other based on iOS. But you can't build native cross-platform executables (executables that work on both iOS and Android) in JavaScript unless you use a tool like Electron. Electron is a very neat little cross-platform framework for building native desktop apps with a WebAssembly module, but it only allows you to write native apps for Windows, macOS, and Linux. So the short answer is, you can't build native cross-platform executables in JavaScript, and even if you did, the learning curve on the tools would be significantly greater than developing a 82157476af
